Implementation Issues

- Two techniques to implement consistency models
 - Primary-based protocols
 - · Assume a primary replica for each data item
 - · Primary responsible for coordinating all writes
 - Replicated write protocols
 - · No primary is assumed for a data item
 - · Writes can take place at any replica

CS677: Distributed and Operating Systems

- 1. Read or write request
- 2. Forward request to current server for x
- 3. Move item x to client's server
- 4. Return result of operation on client's server
- Primary-based local-write protocol in which a single copy is migrated between processes.
 - Limitation: need to track the primary for each data item

process wanting to perform an update

Replicated-write Protocols

- · Relax the assumption of one primary
 - No primary, any replica is allowed to update
 - Consistency is more complex to achieve
- · Synchronous writes to all replicas
- Asynchronous writes to all replicas

- Relax the assumption of one primary ("leaderless")
 - No primary, any replica is allowed to update
 - Consistency is more complex to achieve
- · Quorum-based protocols
 - Use voting to request/acquire permissions from replicas
 - Consider a file replicated on N servers
 - $N_R + N_W > N$ $N_W > N/2$
 - Update: contact N_W servers and get them to agree to do update (associate version number with file)
 - Read: contact N_R and obtain version number
 - · If all servers agree on a version number, read

UMassAmherst

Gifford's Quorum-Based Protoco

- · Three examples of the voting algorithm:
- a) A correct choice of read and write set
- b) A choice that may lead to write-write conflicts
- c) A correct choice, known as ROWA (read one, write all)

Replica Management

- · Replica server placement
 - Web: geophically skewed request patterns
 - Where to place a proxy?
 - · K-clusters algorithm
- · Permanent replicas versus temporary
 - Mirroring: all replicas mirror the same content
 - Proxy server: on demand replication
- Server-initiated versus client-initiated

Final Thoughts

- Prashant Shen...
- Replication and caching improve performance in distributed systems
- · Consistency of replicated data is crucial
- Many consistency semantics (models) possible
 - Need to pick appropriate model depending on the application
 - Example: web caching: weak consistency is OK since humans are tolerant to stale information (can reload browser)
 - Implementation overheads and complexity grows if stronger guarantees are desired

Fault Tolerance

- Single machine systems
 - Failures are all or nothing
 - · OS crash, disk failures
- Distributed systems: multiple independent nodes
 - Partial failures are also possible (some nodes fail)
- Question: Can we automatically recover from partial failures?
 - Important issue since probability of failure grows with number of independent components (nodes) in the systems
 - Prob(failure) = Prob(Any one component fails)=1-P(no failure)

A Perspective

Prashant Shen...

- Computing systems are not very reliable
 - OS crashes frequently (Windows), buggy software, unreliable hardware, software/hardware incompatibilities
 - Until recently: computer users were "tech savvy"
 - · Could depend on users to reboot, troubleshoot problems
 - Growing popularity of Internet/World Wide Web
 - · "Novice" users
 - · Need to build more reliable/dependable systems
 - Example: what is your TV (or car) broke down every day?
 - Users don't want to "restart" TV or fix it (by opening it up)
- Need to make computing systems more reliable
 - Important for online banking, e-commerce, online trading, webmail...

Basic Concepts

Prashant Shen...

- Need to build dependable systems
- Requirements for dependable systems
 - Availability: system should be available for use at any given time
 - 99.999 % availability (five 9s) => very small down times
 - Reliability: system should run continuously without failure
 - Safety: temporary failures should not result in a catastrophic
 - Example: computing systems controlling an airplane, nuclear reactor
 - Maintainability: a failed system should be easy to repair

Basic Concepts (contd)

- Prashant Shen...
- Fault tolerance: system should provide services despite faults
 - Transient faults
 - Intermittent faults
 - Permanent faults

Failure Models

| Type of failure | Description |
|---|--|
| Crash failure | A server halts, but is working correctly until it halts |
| Omission failure Receive omission Send omission | A server fails to respond to incoming requests A server fails to receive incoming messages A server fails to send messages |
| Timing failure | A server's response lies outside the specified time interval |
| Response failure Value failure State transition failure | The server's response is incorrect The value of the response is wrong The server deviates from the correct flow of control |
| Arbitrary failure | A server may produce arbitrary responses at arbitrary times |

• Different types of failures.
